

Our Commitment to Patient Organizations

We at Dynacure are committed to collaborating with patient advocates and advocacy organizations around the world. Together, we share a common goal to raise awareness and improve the lives of patients, their families and caregivers affected by serious rare disorders. Our most advanced drug discovery program is focused on Myotubular and Centronuclear Myopathies (CNM), a family of rare and debilitating disease affecting children and young adults. While a commitment to serving patients transcends every part of our organization, the Patient Advocacy function at Dynacure serves as a liaison between our company and members of the patient and advocacy community. We work together in areas in mutual interest and in accordance with our company values and local country regulations, and we seek to work with Advocacy organizations that follow the same principles. We believe this connection to the patient community makes us stronger and more informed as a company, and it inspires us in our work.

At Dynacure, we:

- Believe the voice of the patient community is critical and should guide our decision-making process.
- Seek out feedback and perspectives from the patient community along our journey as a company and will share our progress and key learnings with you.
- Listen to and value collaboration with advocacy organizations and commit to supporting and working equitably across organizations around the world.
- Follow regulations set forth in countries that state how we can and cannot engage with patients and organizations.
- Respect the independence of the patient organizations that we work with and their important need to act autonomously.
- Persevere relentlessly in our scientific pursuits with the safety and best interests of the CNM community in mind, and follow clinical trial protocols, regulations, and medical privacy rules. The engagement of a patient advocacy organization or a patient advocate with the team at Dynacure has no influence or connection to potential clinical trial recruitment.
- Focus upon our role of raising awareness and addressing the needs of the CNM community, but do not advocate for or promote specific therapies or treatment approaches.

Finally, aspire to continue to learn and evolve based on our engagement with the CNM community, and welcome the opportunity to hear from you. Please reach out to us at patients@dynacure.com with feedback or suggestions.
